
Coin classification using convolutional networks

1 Description

Convolutional neural networks [1, 2, 3] are ones of the most employed DNN architectures. They are particularly efficient for computer vision tasks such as image classification [4, 5].

2 Objectives

The goal of the project is to design a convolutional network that classify coin images into two classes: 1) Coins from the Roman times. 2) Other coins. Two different datasets will be used: The coinsdataset available from <https://github.com/despoisj/CoinsDataset/blob/master/README.md> and the Coin Image Dataset containing which is available from <https://cvi.tuwien.ac.at/research/cvi-databases/coin-image-dataset/>. The joint coin dataset will be very unbalanced.

The student should: 1) Create a single dataset with all the images scaled to the same size. 2) Preprocess the images. 3) Design the network architecture and train it. 4) Validate the network.

As in other projects, a report should describe the characteristics of the design, implementation, and results. A Jupyter notebook should include calls to the implemented function that illustrate the way it works.

3 Suggestions

- See previous approaches to coin classification, e.g. https://link.springer.com/chapter/10.1007%2F978-3-642-37484-5_3.
- Implementations can use any Python library that implements DNNs.
